(54) Title: COMPOUNDS

(57) Abstract: Compounds of formula (I) where R<sub>2</sub>, each X, L, Y, Cy, Lp, D and n are as defined in the specification, are serine protease inhibitors useful as antithrombotic agents.

### Compounds

This invention relates to compounds which are inhibitors of serine proteases and to pharmaceutical compositions thereof and their use in the treatment of the human or animal body.

The serine proteases are a group of proteolytic enzymes which have a common catalytic mechanism characterized by a particularly reactive Ser residue. Examples of serine proteases include trypsin, tryptase, chymotrypsin, elastase, thrombin, plasmin, kallikrein, Complement C1, acrosomal protease, lysosomal protease, cocoonase,  $\alpha$ -lytic protease, protease A, protease B, serine carboxypeptidase II, subtilisin, urokinase, Factor VIIa, Factor IXa, and Factor Xa. The serine proteases have been investigated extensively over a period of several decades and the therapeutic value of inhibitors of serine proteases is well understood.

Serine protease inhibitors play a central role in the regulation of a wide variety of physiological process including coagulation, fibrinolysis, fertilization, development, malignancy, neuromuscular patterning and inflammation. It is well known that these compounds inhibit a variety of circulating proteases as well as proteases that are activated or released in tissue. It is also becoming clear that serine protease inhibitors inhibit critical cellular processes, such as adhesion, migration, free radical production and apoptosis. In addition, animal experiments indicate that intravenously administered serine protease inhibitors, variants or cells expressing serine protease inhibitors, provide a protective effect against tissue damage.

Serine protease inhibitors have also been predicted to have potential beneficial uses in the treatment of disease in a wide variety of clinical areas such as oncology, neurology, haematology, pulmonary medicine, immunology, inflammation and infectious disease.

In particular serine protease inhibitors may be beneficial in the treatment of thrombotic diseases, asthma, emphysema, cirrhosis, arthritis, carcinoma, melanoma, restenosis, atheroma, trauma, shock and reperfusion injury.

Thus for example an inhibitor of Factor Xa has value as a therapeutic agent as an anticoagulant, e.g. in the treatment and prevention of thrombotic disorders. The use of a Factor Xa inhibitor as an anticoagulant is desirable in view of the selectivity of its effect. Many clinically approved anticoagulants have been associated with adverse events owing to the non-specific nature of their effects on the coagulation cascade.

Also, there are well-known associations of  $\alpha 1$  protease inhibitor deficiency with emphysema and cirrhosis and C1 esterase inhibitor deficiency with angioedema.

It has now been found that certain aromatic compounds carrying bulky lipophilic side chains are particularly effective as inhibitors of serine proteases, especially proteases with negatively charged P1 specificity pockets, and most especially the serine proteases thrombin, and most importantly Factor Xa. The Factor Xa inhibitors of this invention are potentially useful for the prophylaxis or treatment of thrombotic disorders such as amongst others venous thrombosis, pulmonary embolism, arterial thrombosis, myocardial ischaemia, myocardial infarction, and cerebral thrombosis. They potentially have benefit in the treatment of acute vessel closure associated with thrombolytic therapy

and restenosis, e.g. after transluminal coronary angioplasty or bypass grafting of the coronary or peripheral arteries and in the maintenance of vascular access patency in long term hemodialysis patients.

5       Factor Xa inhibitors of this invention may, with benefit, form part of a combination therapy with an anticoagulant with a different mode of action or with a thrombolytic agent.

10       Hence, the invention also comprises certain compounds which have been found to be inhibitors of both Factor Xa and thrombin. These compounds have excellent potential therapeutic value and may synergistically boost Fxa antithrombotic effect.

15       It has been reported in WO99/11658 and WO99/11657 that certain benzamidine and aminoisoquinoline derivatives carrying a bulky lipophilic side chain are excellent inhibitors of serine proteases. Unfortunately, it has since been found that benzamidine compounds of WO 99/11658 in general demonstrate poor oral bioavailability.

20       Surprisingly, it has now been found that certain other aromatic compounds also show inhibitory activity against serine proteases, in particular Factor Xa, despite the lack of the amidino or 1-aminoisoquinoline functionality previously believed to be crucial for activity as a factor  
25       Xa inhibitor. Many of these compounds also possess other structural features that further distinguish them from the compounds of WO99/11658 and WO99/11657.

30       Where compounds of the invention have been tested, they have generally demonstrated superior oral bioavailability in comparison with benzamidines disclosed in WO 99/11658. Also, it has been found that the compounds of the invention perform excellently in the prothrombin time assay (PT) when

compared to aminoisoquinolines of similar factor Xa activity and structure. The PT assay is a coagulation assay and it is widely accepted that direct acting Factor Xa inhibitors which perform well in the PT assay are more likely to be  
 5 good antithrombotics.

In WO99/09053 certain 2-aminobenzamide compounds are disclosed as potential motilin receptor antagonists and in US 3268513 similar 2-aminobenzamide compounds are suggested as potential antibacterial agents. However, the novel  
 10 compounds of the present invention have not before been suggested as potential serine protease inhibitors.

Thus viewed from an one aspect the invention provides a serine protease inhibitor compound of formula (I)

or a physiologically tolerable salt thereof, e.g. a halide, phosphate or sulphate salt or a salt with ammonium or an organic amine such as ethylamine or meglumine.

Compounds of formula I as defined above, but in which  
5  $R_1$  is an unsubstituted aminoalkyl group are claimed in a co-pending application.

In the compounds of the invention, where the alpha atom is carbon it preferably has the conformation that would result from construction from a D- $\alpha$ -aminoacid

10  $NH_2-CR_{1b}(Cy)-COOH$  where the  $NH_2$  represents part of X-X. Likewise the fourth substituent  $R_{1b}$  at an alpha carbon is preferably a methyl or hydroxymethyl group or hydrogen.

In the compounds of the invention, unless otherwise indicated, aryl groups preferably contain 5 to 10 ring atoms  
15 optionally including 1, 2 or 3 heteroatoms selected from O, N and S; alkyl, alkenyl or alkynyl groups or alkylene moieties preferably contain up to 6 carbons, e.g.  $C_{1-6}$  or  $C_{1-3}$ ; cyclic groups preferably have ring sizes of 3 to 8 atoms; and fused multicyclic groups preferably contain 8 to  
20 16 ring atoms.

Examples of particular values for  $R_{1a}$  are: hydrogen, methyl or ethyl.  $R_{1a}$  is preferably a hydrogen atom.

The linker group from the  $R_2$  group to the alpha atom is preferably selected from  $-CH=CH-$ ,  $-CONH-$ ,  $-CONR_{1a}-$ ,  $-NH-CO-$ ,  
25  $-NH-CH_2-$ ,  $-CH_2-NH-$ ,  $-CH_2O-$ ,  $-OCH_2-$ ,  $-COO-$ ,  $-OC=O-$  and  $-CH_2CH_2-$ . Preferably, the X moiety nearest to the alpha atom is an NH or O atom, most preferably a NH group. The X moiety alpha to the aromatic ring is preferably a carbon based group such as  $CH_2$  or CO, preferably CO. Thus a

The linker may be optionally branched, for example, to incorporate a polar functionality.

Examples of particular values for L are CO, CONH, CH<sub>2</sub>NHCO and CONHCH<sub>2</sub>.

It will be appreciated by those skilled in the art that a diverse range of organic groups are lipophilic, and that it is therefore impractical to define with precision each and every structure that may be incorporated into a serine protease inhibitor according to the invention. Accordingly, it is being assumed that the addressee of this specification will not require an exhaustive computer listing of structures of lipophilic groups, but will instead make use of the structures of lipophilic groups disclosed in the specification, especially those exemplified; the test systems described herein for identifying serine protease inhibitors; and common general knowledge of the lipophilicity, synthesis and stability of organic compounds, to obtain novel serine protease inhibitor compounds of formula (I).

The lipophilic group may be, for example, an alkyl, alkenyl, carbocyclic or heterocyclic group, or a combination of two or more such groups linked by a spiro linkage or a single or double bond or by C=O, O, S, SO, SO<sub>2</sub>, CONR<sub>1e</sub>, NR<sub>1e</sub>-CO-, NR<sub>1e</sub> linkage (where R<sub>1e</sub> is as defined for R<sub>1a</sub>), optionally substituted by one or more oxo or R<sub>3</sub> groups in which R<sub>3</sub> is as defined for R<sub>3a</sub>.

By way of illustration, representative lipophilic groups include methylcyclohexyl, methylcyclohexylmethyl, methylphenylmethyl, phenylethyl, benzylpiperidinyl, benzoylpiperidinyl, bispiperidinyl and phenylpiperazinyl.

Phenylethyl is an example of a combination of an alkyl group and a carbocyclic group linked through a single bond.

Benzylpiperidinyl is an example of a combination of an alkyl group, a carbocyclic group and a heterocyclic group linked by single bonds.

5 Benzoylpiperidinyl is an example of a combination of a carbocyclic group and a heterocyclic group linked through C=O.

Methylcyclohexylmethyl is an example of a combination of an alkyl group (methyl) and a carbocyclic group (cyclohexyl) linked by a single bond and having a  
10 substituent  $R_3$  (methyl) on cyclohexyl. It will be appreciated that this group could alternatively have been regarded as a combination of two alkyl groups and a carbocyclic group. However, in order to provide clarity, in this specification any terminal alkyl group in  $L_p$  will be  
15 treated as a substituent  $R_3$ .

When the lipophilic group comprises an alkyl group, this may be, for example, a (1-3C) alkyl group, such as methyl, ethyl or propyl. Preferably an alkyl group is unsubstituted.

20 When the lipophilic group comprises a carbocyclic group, this may be, for example, a non-aromatic or aromatic, mono or polycyclic hydrocarbon group containing up to 25, more preferably up to 10 carbon atoms. The carbocyclic group may thus be, for example, a cycloalkyl, polycycloalkyl,  
25 phenyl or naphthyl group, or a cycloalkyl group fused with a phenyl group.

Examples of particular values for a cycloalkyl group are (3-6C) cycloalkyl groups, such as cyclopentyl and cyclohexyl. A cycloalkyl group is preferably unsubstituted  
30 or substituted by one group  $R_3$ , preferably amino or an alkyl group, such as methyl.

Examples of particular values for a polycycloalkyl group are (6-10C) polycycloalkyl groups, such as bicycloalkyl, for example decaliny1, norbornyl or adamantyl. A polycycloalkyl group is preferably unsubstituted.

5 A phenyl group is preferably unsubstituted or substituted by one or two  $R_3$  groups. More preferably it is substituted by one or two  $R_3$  groups.

A naphthyl group is preferably unsubstituted or substituted by one  $R_3$  group.

10 Examples of a cycloalkyl or cycloalkenyl group fused with a phenyl group are indanyl and tetrahydronaphthyl. This group is preferably unsubstituted.

When the lipophilic group comprises a heterocyclic group, this may be, for example, a non-aromatic or aromatic,  
15 mono or polycyclic group containing one or two oxygen, nitrogen or sulfur atoms in the ring system, and in total up to 25, more preferably up to 10 ring system atoms.

Examples of a heterocyclic group when it is a non-aromatic monocyclic group are azacycloalkyl groups, such as  
20 pyrrolidinyl and piperidinyl; azacycloalkenyl groups, such as pyrrolinyl; diazacycloalkyl groups, such as piperazinyl; oxacycloalkyl groups, such as tetrahydropyranyl; and thiacycloalkyl groups, such as tetrahydrothiopyranyl. A non-aromatic monocyclic group preferably contains 5, 6 or 7 ring  
25 atoms and is preferably unsubstituted or substituted by one group  $R_3$ , preferably alkyl, such as methyl or ethyl, or hydroxyalkyl, such as hydroxymethyl.

Examples of a heterocyclic group when it is a non-aromatic polycyclic group are bicyclic groups, such as  
30 azacycloalkyl fused with phenyl, for example dihydroindolyl, dihydroisoindolyl, tetrahydroquinoliny1 and tetrahydroisoquinoliny1; and tricyclic groups, such as

azacycloalkyl fused with indolyl, for example tetrahydropyrido[3,4-b]indole. This group is preferably unsubstituted.

5 Examples of a heterocyclic group when it is a aromatic monocyclic group are furyl, pyrrolyl, thienyl, imidazolyl, pyridyl, pyridazinyl, pyrimidinyl, pyrazinyl, oxazolyl, oxadiazolyl (such as 1,3,4-oxadiazolyl), thiadiazolyl (such as 1,3,4-thiadiazolyl) and thiazolyl. This group is preferably unsubstituted or substituted by one  $R_3$ .

10 Examples of a heterocyclic group when it is an aromatic polycyclic group are bicyclic groups such as benzofuryl, quinolinyl, isoquinolinyl and benzothienyl. This group is preferably unsubstituted or substituted by one  $R_3$ .

The lipophilic group preferably comprises a cycloalkyl, 15 azacycloalkyl, diazacycloalkyl, phenyl, naphthyl, adamantyl, bicycloalkyl, mono- or diazabicycloalkyl, mono- or bicyclo heteroaromatic or a linear or branched alkyl or alkenyl group all optionally substituted by one or more groups  $R_3$ , or a combination of at least two such groups linked by a 20 spiro linkage or a single or double bond or by C=O, O, S, SO, SO<sub>2</sub>, CONR<sub>1e</sub>, NR<sub>1e</sub>-CO- or NR<sub>1e</sub> linkage (where  $R_{1e}$  is as defined for  $R_{1a}$ ).

Where Lp comprises a combination of at least two groups, it preferably comprises a combination of two or 25 three such groups. The groups are preferably linked by a single bond, C=O, O or NR<sub>1e</sub>.

Of particular interest are compounds of formula I in which Lp comprises an azacycloalkyl or diazacycloalkyl group of formula

in which  $r$  is 1 or 2, one of  $X_a$  and  $X_b$  is N and the other is CH or N, provided that when  $r$  is 1,  $X_a$  and  $X_b$  are not both N.

10 Most preferably, the lipophilic group Lp is selected from

5

5

10

22

5

10

5

wherein R<sub>3</sub> is as hereinbefore defined;

5 m represents 0 or 1;

R<sub>4</sub> represents hydrogen, (CH<sub>2</sub>)<sub>w</sub>COOH or (CH<sub>2</sub>)<sub>w</sub>CONH<sub>2</sub>;

w represents an integer from 0 to 4; and

X represents CH or N.

Where two or more X atoms are present in a ring,  
10 preferably at least one is CH.

When R<sub>3</sub> is present as a substituent on an aromatic ring, it is preferably selected from hydrogen, alkylsulphonyl, aminosulphonyl, alkylaminosulphonyl, alkylaminocarbonyl, amino, amido, alkoxycarbonyl, 15 acetylamino, chloro, fluoro, cyano, methoxy, ethoxy, nitro, hydroxy, alkylsulphonylamino, triazolyl and tetrazolyl.

One group of lipophilic groups Lp is that of formula

in which  $L_x$  represents O or NH.

For example specific lipophilic groups include

5

where  $R_8$  is as defined for  $R_3$  (preferably as defined for a  
 5 substituent on an aromatic ring), especially where  $R_8$   
 represents H, OMe,  $\text{SO}_2\text{Me}$ , F, cyano, amido, amino,  $\text{NO}_2$ , Cl or

 or 2-propyl).

Another highly preferred lipophilic group is of formula  
 10 (DP)

(DP)

wherein A represents N or CH (preferably N) and  $R_3$  is as  
 15 hereinbefore defined. When the lipophilic group is (DP) it  
 is preferred that the group L represents CO,  $\text{CH}_2$  or  $\text{SO}_2$ .  
 Also, it is preferred if the  $R_3$  groups in the formula DP are  
 hydrogen.

Hence, preferred compounds of the invention are those of formula (J)

5 where  $R_2$ , X-X, and Cy are as hereinbefore defined and L represents CO,  $CH_2$  or  $SO_2$ .

Another highly preferred lipophilic group is based on the formula (K)

10 wherein  $X_2$  is halo, hydrogen, amino, nitro or  $CONH_2$ .

Preferably  $X_2$  is hydrogen or fluoro. Compounds in which the lipophilic group is based on the formula (K) or (J) have been found to perform relatively well in the prothrombin  
15 time assay, when compared with corresponding aminoisoquinolines of WO99/11657.

Where the donor atom is a ring nitrogen,  
25 the remote portion of the heterocyclic ring may be part of the lipophilic group.

10 In a particularly favoured embodiment the R<sub>2</sub> group is an indole as marked by a \* above in which R<sub>5</sub> is hydrogen and R<sub>3</sub> is a hydrogen or halogen present at the 3 position.

It is preferred that at least one of R<sub>6</sub> and R<sub>7</sub> be other than hydrogen and that R<sub>6</sub>, if present, is preferably a substituent containing one or more polar hydrogens such as  
 15 hydroxy, amino, alkylamino, alkylaminoalkyl, aminocarbonyl, alkylaminocarbonyl, hydrazo and alkylhydrazo; alternatively R<sub>6</sub> and R<sub>7</sub> are joined together in the formation of a naphthyl or indolyl or azaindolyl or diazaindolyl group.

It is especially preferred that R<sub>6</sub> be amino and R<sub>7</sub> be  
 20 chloro, bromo, methyl, methoxy or vinyl; or that R<sub>6</sub> and R<sub>7</sub> taken together form an indolyl ring with the NH at the 6-position or taken together form a naphthyl ring.

In a further preferred embodiment the compounds of the invention are of formula (A)

(A)

- 5 (wherein  $R_5$ ,  $R_6$ ,  $R_7$ , Ar, X-X,  $Lp_1$ ,  $D_n$  are as hereinbefore defined;  $L_2$  is a valence bond or an organic linker group containing 1 to 3 backbone atoms selected from C, N, O and S and  $R_{8a}$  and  $R_{9a}$  are hydrogen or taken together with the carbon atom to which they are attached form a carbonyl group). Again, in an alternative embodiment the phenyl derivative forming part of the  $R_2$  functionality may instead be a nitrogen heterocyclic group, e.g. pyridine.

15 In one embodiment,  $L_2$  comprises the backbone of an alpha amino acid, the lipophilic group being the side chain of the amino acid.

In one preferred embodiment  $R_{8a}$  and  $R_{9a}$  are hydrogen and  $L_2$  is a  $OC=O$  or  $NHC=O$  group.

20 In a preferred embodiment,  $L_2$  represents a valence bond and the lipophilic group is bound directly to a carbonyl alpha to the alpha atom via a nitrogen atom which forms part of the lipophilic group. Suitable lipophilic groups in this case therefore include piperidinyl, pyrrolidinyl and piperazinyl. In a preferred embodiment the piperidine or piperazinyl group is further substituted by a phenyl, benzyl, phenoxy, piperidine, pyridine or benzoyl group, optionally substituted on the phenyl ring by one or more  $R_3$  groups. In a more preferred embodiment a piperazine is

substituted with a phenyl group substituted at the 2-position with an electron withdrawing group such as fluoro, nitro, triazolyl, cyano, alkoxy, carbonyl, aminocarbonyl, aminosulphonyl, alkylaminosulphonyl and, especially preferred, alkylsulphonyl; and, at the 4-position, with hydrogen, fluoro, alkoxy or hydroxy. In another more preferred embodiment a piperidine is substituted at the 4-position with 4-piperidine which itself may be substituted on nitrogen by alkyl or aminocarbonylalkyl or alkylaminocarbonyl alkyl.

In a further embodiment, the lipophilic group has attached a group of the formula  $-\text{COOR}_{1g}$  or  $-\text{CON-}$ aminoacid or ester derivative thereof (where  $R_{1g}$  is as defined for  $R_{1a}$ ). Particularly preferred compounds are those of formula (G)

(G)

(wherein Ar,  $R_6$  and  $R_7$  are as hereinbefore defined,  $R_5$  represents hydrogen or amino and

represents a cyclic group) or of formula (H)

(H)

(wherein  $R_6$  and  $R_7$  are as hereinbefore defined, and  $R_5$  represents hydrogen or amino). In a preferred embodiment  $R_6$  is amino and  $R_7$  a halogen, especially chlorine.

Again, in an alternative embodiment the phenyl derivative forming part of the  $R_2$  functionality in formulae (G) and (H) may instead be a nitrogen heterocyclic group, e.g. pyridine, indole.

In another embodiment the group binding the alpha carbon atom to the lipophilic group comprises a heterocyclic group. Accordingly, preferred compounds of the invention also include those of formula (III)

(III)

(wherein  $R_5$ ,  $R_6$ ,  $R_7$ ,  $Ar$ ,  $X-X$ ,  $Lp_1$ ,  $D_n$  are as hereinbefore defined;

$m$  is 0, 1 or 2;

Het is a 5 or 6-membered heterocyclic group interrupted by 1, 2 or 3 heteroatoms selected from O, N and S optionally substituted by a group  $R_{3b}$  where  $R_{3b}$  is as defined for  $R_3$ ).

Again, in an alternative embodiment the phenyl derivative forming part of the  $R_2$  functionality may instead be a nitrogen heterocyclic group, e.g. pyridine.

Where Het is a five membered ring, the two ring atoms at which it is connected are preferably separated by one ring atom. Where Het is a six-membered ring, the two ring atoms at which it is connected are preferably separated by one or two ring atoms. Representative heterocyclic groups include thiazole, oxazole, oxadiazole, triazole, thiadiazole or imidazole. Where the heterocyclic group is substituted by  $R_{3b}$  this is preferably a COOH or  $COOR_{1h}$  connected to the heterocycle via a valence bond or alkylene chain (where  $R_{1h}$  is as defined for  $R_{1a}$ ).

In a further embodiment, the lipophilic group has attached a group of the formula  $-COOR_{1g}$  or  $-CON$ -aminoacid or ester derivative thereof.

In an alternative embodiment, the main aromatic  $R_2$  ring in the compounds of the invention is a five membered aromatic ring leading to compounds of formula (IV) or (IVa)

(IV)

(IVa)

(wherein  $R_5$ ,  $R_6$ ,  $R_7$ ,  $X-X$ ,  $Ar$ ,  $L_1$ ,  $Lp_1$ ,  $D$  and  $n$  are as hereinbefore described for formula (II) and  $Z$  represents  $N$ ,  $O$  or  $S$ ). It is preferred that at least one of  $R_6$  and  $R_7$  be other than hydrogen, or that  $R_6$  and  $R_7$  taken together enable the formation of an indolyl, or azaindolyl group or diazaindolyl group. Preferences for other substituents are as for formula (A) above. Examples of possible fused systems are given below.

Hence in a preferred embodiment the compounds of the invention are of formula C or D

5

(wherein  $R_5$ ,  $R_6$ ,  $R_7$ ,  $Ar$ ,  $X-X$ ,  $Z$ ,  $R_8$ ,  $R_9$ ,  $L_2$ ,  $Lp_1$ ,  $D_n$  are as  
 10 hereinbefore defined) preferences for  $Ar$ ,  $X-X$ ,  $R_{8a}$ ,  $R_{9a}$ ,  $L_2$ ,  
 $Lp_1$ ,  $D_n$  are as for formula (A) above; or compounds of  
 formula E or F:

51

(F)

wherein  $Lp_1$  is connected to the carbonyl via a nitrogen atom,  $R_6$ ,  $R_7$ ,  $Ar$ ,  $Z$ ,  $Lp_1$ ,  $D_n$  are as hereinbefore defined and  $R_5$  is hydrogen or amino) preferences for  $Ar$ ,  $Lp_1$ ,  $D_n$  are as  
 5 for formula (A) above.

Particularly preferred are the compounds of formula I of Examples 35, 63, 66, 73, 100, 318 and 320, and physiologically tolerable salts thereof.

As previously mentioned, a number of compounds of the  
 10 invention have been found to be excellent mixed inhibitors in that they inhibit both the serine proteases Factor Xa and thrombin. Such mixed inhibitors are preferably based on the formula (L)

(L)

15 wherein  $R'$  represents

$X_3$  represents hydrogen or a polar group such as amino or  $\text{CONH}_2$ , especially  $\text{CONH}_2$ ; and

- 5  $R''$  represents a cyclic group bound to the carbonyl by a nitrogen atom or an optionally substituted group of formula

- The compounds of the invention may be prepared by  
 10 conventional chemical synthetic routes or by routes as  
 illustrated by the following examples, e.g. by amide bond  
 formation to couple the aromatic function to the alpha atom  
 and to couple the lipophilic function to the alpha atom.  
 Where the alpha atom is a carbon, the cyclic group-alpha  
 15 atom combination may conveniently derive from an alpha amino

acid with the aromatic deriving from for example an acid derivative of a compound based on  $R_2$ , e.g. o-amino-benzoic acid. Amide formation from such reagents (in which any amino or hydroxyl function may if desired be protected during some or all of the synthesis steps) yields a compound of formula (V).

(where Cy and  $R_2$  are as defined above).

The lipophilic group (and optionally simultaneously the hydrogen bond donor) may then conveniently be introduced by reaction of a compound of formula (V) (or another analogous carboxylic acid) optionally after transformation into an activated form, e.g. an acid chloride or active ester, with a lipophilic group carrying an amine, hydroxylamine, hydrazine or hydroxyl group, e.g. to produce compounds with linkages of  $\text{-CO-NR}_{1d}\text{-}$ ,  $\text{-CO-NR}_{1d}\text{-O-}$ ,  $\text{-CO-NR}_{1d}\text{-NR}_{1d}\text{-}$  and  $\text{-CO-O-}$  from the alpha atom (where it is a carbon) to the lipophilic group. Cyclisation can be base induced via nucleophilic attack of the alpha atom on a leaving group on the active side chain. If necessary the amide linkage can be reduced using an appropriate reducing agent employing the necessary protection depending on whether concurrent reduction of the carboxylic acid moiety is also desired. Alternatively a compound of formula V or another analogous carboxylic acid may be transformed into an alcohol by reaction with isobutylchloroformate and reduction with sodium borohydride.

Such an alcohol, e.g. of formula VI

can be reacted to introduce the lipophilic group by reactions such as:

alkylation with an alkyl halide in the presence of a  
5 base;

under Mitsunobu conditions, such as reaction with diethyl azodicarboxylate/triphenylphosphine and a hydroxylated aryl compound;

by reaction with an activated carboxylic acid (e.g. an  
10 acid chloride) or with a carboxylic acid and diethylazodicarboxylate/triphenylphosphine;

by reaction with an isocyanate; and

by treatment with methanesulphonyl chloride or trifluoromethanesulphonic anhydride and reaction with an  
15 amine, or with a thiol optionally followed by oxidation, e.g. with potassium metaperiodate or hydrogen peroxide.

Alternatively, the reactions described above may be performed on a corresponding compound of formula (VI) in which  $R_2$  is replaced with a protecting group, such as t-butoxycarbonyl (Boc), followed by deprotection and  
20 introduction of the group  $R_2$ .

In this way compounds with linkages of  $-CH_2-O-$ ,  $-CH_2-O-CO-$ ,  $-CH_2-O-CO-NR_{1d}-$ ,  $-CH_2-NR_{1d}-$ ,  $-CH_2-S-$ ,  $-CH_2-SO-$  and  $-CH_2-SO_2-$  between the alpha carbon and the lipophilic  
25 group may be produced.

Alternatively the alcohol can be oxidized to form a corresponding aldehyde (e.g. by oxidation with manganese dioxide or DMSO/oxalyl chloride or DMSO/ $SO_3$  or Dess-Martin reagent) which may be reacted to introduce the lipophilic  
30 group by reactions such as:

reaction with Wittig reagents or Horner-Emmons reagents, optionally followed by reduction of the resulting carbon:carbon double bond using  $H_2/Pd$ -carbon;

reaction with an organometallic, eg a Grignard reagent,  
5 optionally followed by reaction on the resulting hydroxyl group, such as oxidation (eg with  $MnO_2$ , DMSO/oxalyl chloride or Dess-Martin reagent), alkylation (eg with an alkyl halide in the presence of a base in a solvent such as DMF), arylation (eg with diethylazo dicarboxylate/triphenyl  
10 phosphine and a hydroxyaryl compound), ester formation (eg with an acid chloride or with a carboxylic acid and diethylazido dicarboxylate/triphenyl phosphine), or carbamate formation (eg with an isocyanate);

by reaction with an amine followed by reduction, e.g.  
15 with sodium cyanoborohydride;

by reaction with a hydrazine; or

by reaction with a carbazide.

In this way compounds with linkages of  $-CH=CR_{1d}-$ ,  
 $-CH_2-CHR_{1d}-$ ,  $-CHOH-$ ,  $-CHR_{1d}-O-$ ,  $-CHR_{1d}-O-CO-$ ,  
20  $-CHR_{1d}-O-CO-NR_{1d}-$ ,  $-CO-$ ,  $-CH_2-NR_{1d}-$ ,  $-CH=N-NR_{1d}-$  and  
 $-CH=N-NR_{1d}-CO-NR_{1d}-$  between the alpha carbon and the lipophilic group may be produced.

The transformation of alcohol to amine referred to above may be used to produce an amine reagent for lipophilic  
25 group introduction, e.g. a compound

Such an amine reagent may be reacted to introduce the lipophilic group, e.g. by acylation with an acid halide or activated ester, by reaction with isocyanate, by reaction  
30 with an isothiocyanate, or by reaction with a sulphonyl chloride. In this way compounds with linkages of  $-CH_2NR_{1d}-CO-$ ,  $-CH_2-NR_{1d}-CO-NR_{1d}-$ ,  $-CH_2NR_{1d}-CS-NR_{1d}-$  and  $-CH_2NR_{1d}-SO_2-$

between the alpha carbon and the lipophilic groups may be produced.

The transformation of acid to amide referred to above may be used to produce an amide reagent for introduction of the lipophilic group, e.g. a compound

Such amides may be reacted to introduce lipophilic groups, e.g. by reaction with a haloketone (e.g. phenacyl bromide). This provides a linkage

from alpha carbon to lipophilic group.

Analogously the amide may be transformed to a thioamide by reaction with Lawesson's reagent and then reacted with a haloketone to form a linkage

The amide reagent may likewise be transformed to a nitrile reagent by dehydration, e.g. with trifluoroacetic anhydride. The nitrile reagent may be reacted with hydrazine then with acyl halide and then cyclized, (e.g. with trifluoroacetic anhydride) to produce a linkage

Alternatively it may be treated with hydroxylamine then reacted with acyl halide and cyclized (e.g. with trifluoroacetic anhydride) to produce a linkage

The hydrazide produced by reaction of a carboxylic acid reagent with hydrazine discussed above may likewise be used as a reagent for lipophilic group introduction, e.g. as a  
 5 compound of formula

Thus the hydrazide reagent can be reacted with an acyl halide and cyclized, e.g. with trifluoroacetic anhydride to yield a linkage

10

or reacted with an acyl halide or an isocyanate to yield linkages  $\text{-CO-NR}_{1d}\text{-NR}_{1d}\text{-CO-}$  and  $\text{-CO-NR}_{1d}\text{-NR}_{1d}\text{-CO-NR}_{1d}\text{-}$  respectively.

Alternatively the hydrazide may be transformed by  
 15 reaction with Lawesson's reagent and then reacted with an acyl halide and cyclized (e.g. with trifluoroacetic anhydride) to produce the linkage

An alternative route to these compounds is to carry out  
 20 any of the above chemical reactions to incorporate the lipophilic group (and optional H bond donor) into a protected intermediate such as a compound of formula (VII).

PG = Protecting group

The protecting group may then be removed before coupling of the for example o-amino benzoic acid (optionally protected).

The protection of amino and carboxylic acid groups is described in McOmie, *Protecting Groups in Organic Chemistry*, Plenum Press, NY, 1973, and Greene and Wuts, *Protecting Groups in Organic Synthesis*, 2nd. Ed., John Wiley & Sons, NY, 1991. Examples of carboxy protecting groups include C<sub>1</sub>-C<sub>6</sub> alkyl groups such as methyl, ethyl, t-butyl and t-amyl; aryl(C<sub>1</sub>-C<sub>4</sub>)alkyl groups such as benzyl, 4-nitrobenzyl, 4-methoxybenzyl, 3,4-dimethoxybenzyl, 2,4-dimethoxybenzyl, 2,4,6-trimethoxybenzyl, 2,4,6-trimethylbenzyl, benzhydryl and trityl; silyl groups such as trimethylsilyl and t-butyldimethylsilyl; and allyl groups such as allyl and 1-(trimethylsilylmethyl)prop-1-en-3-yl.

Examples of amine protecting groups (PG) include acyl groups, such as groups of formula RCO in which R represents C<sub>1-6</sub> alkyl, C<sub>3-10</sub> cycloalkyl, phenyl C<sub>1-6</sub> alkyl, phenyl, C<sub>1-6</sub> alkoxy, phenyl C<sub>1-6</sub> alkoxy, or a C<sub>3-10</sub> cycloalkoxy, wherein a phenyl group may be optionally substituted, for example by one or two of halogen, C<sub>1</sub>-C<sub>4</sub> alkyl and C<sub>1</sub>-C<sub>4</sub> alkoxy. Preferred amino protecting groups include benzyloxycarbonyl (CBz), t-butoxycarbonyl (Boc) and benzyl.

Compounds of the type (VII) made be prepared (for example) by one or more of the following methods.

(i) from aryl or heteroaryl aldehydes via the Strecker synthesis or modifications thereof, via Bucherer-Bergs

hydantoin synthesis, or via the Ugi methodology (Isonitrile Chemistry, Ugi I. Ed.; Academic: New York, 1971; pp145-199) with removal and replacement of protecting groups;

(ii) from styrenes via Sharpless methodology (J. Am. Chem. Soc. 1998, 120, 1207-1217)

(iii) from aryl boronic acids via Petasis methodology (Tetrahedron, 1997, 53, 16463-16470) with removal and replacement of protecting groups;

(iv) from aryl and heteroaryl acetic acids - via Evan's azidation (Synthesis, 1997, 536-540) or by oximation, followed by reduction and addition of protecting groups; or

(v) from existing aryl glycines by manipulation of functional groups, for example, alkylation of hydroxy groups, palladium assisted carbonylation of triflates derived from hydroxy groups and further manipulation of the carboxylic esters to give carboxylic acids by hydrolysis, carboxamides by activation of the carboxylic acid and coupling with amines, amines via Curtius reaction on the carboxylic acid or

(vi) from aliphatic, carbocyclic and non-aromatic heterocyclic aldehydes and ketones using a Horner-Emmons reaction with N-benzyloxycarbonyl)- $\alpha$ -phosphonoglycine trimethyl ester (Synthesis, 1992, 487-490).

A starting reagent for lipophilic group introduction where the alpha atom is nitrogen may be produced for example by reaction of a beta protected hydrazine (such protection to be chosen as to be compatible with the subsequent reagents to be employed) with phosgene, diphosgene, triphosgene or N,N'-carbonyl diimidazole to give a reactive compound of the type:

PG = Protecting group

This intermediate may be used as has been described above for the carboxylic starting reagents where the alpha atom is carbon.

Removal of the protecting group by standard methods and coupling with an activated aryl carboxylic acid will give compounds of the type

(where  $\text{R}_2$ , X, Y, Cy, L, Lp and D are as defined above).

Thus viewed from a further aspect the invention provides a process for the preparation of a compound according to the invention which process comprises coupling a lipophilic group to a compound of formula (VIII)

(wherein  $\text{R}_2$ , X, Y and Cy are as defined above and  $\text{Z}_1$  is a reactive functional group), and optionally subsequently coupling a hydrogen bond donor group to said lipophilic group.

Instead of introducing the group  $\text{L}-\text{Lp}(\text{D})_n$  as the final stage process step, the compounds of formula I may alternatively be prepared by a process in which the group  $\text{R}_2$  is introduced in the final process step.

Thus viewed from another aspect the invention provides a process for the preparation of a compound according to the invention which process comprises coupling a lipophilic group to a compound of formula (IX)

5

(wherein Y, Cy, L, Lp D, and n are as defined above and  $Z_2$  is HX or a reactive functional group), or a protected derivative thereof, with a compound of formula (X)

10

(wherein  $R_2$  is as defined above and  $Z_3$  is XH or an appropriate reactive group), or a protected derivative thereof, followed if necessary by the removal of any protecting groups.

15

Thus, for a compound of formula I in which X-X represents CONH, a compound of formula (IX) in which  $Z_2$  is  $H_2N$  may be reacted with a compounds of formula (X) in which  $Z_3$  is COOH or a reactive derivative thereof, such as a acyl halide or an anhydride, for example as described in the Examples herein.

20

Where the lipophilic group Lp comprises more than one group, it may generally be formed by coupling these groups together at an appropriate stage in the preparation of the compound of formula I using conventional methods or as described in the Examples.

25

For a compound of formula I in which Lp comprises an azacycloalkyl or diazacycloalkyl group of formula

in which  $X_b$  is N and each of  $s$  and  $u$  is 0, alkylating the amino group of a corresponding compound in which the corresponding residue is of formula

5

using a conventional alkylating method. The alkylation may be carried out using any conventional method; however, generally preferred is a reductive alkylation using the appropriate aldehyde or ketone, for example as described in the Alkylation Methods in the Examples.

10

Thus, a particular starting material for the alkylation is one of formula

in which  $X_a$  is N and  $L$  is CO or  $X_a$  is CH and  $L$  is CONH,

15 CONHCH<sub>2</sub> or CH<sub>2</sub>NHCO.

For a compound of formula I in which  $L_p$  comprises an azacycloalkyl or diazacycloalkyl group of formula

20

in which  $R_{10}$  is a group of formula

in which  $X_d$  is N and  $R_{11}$  is (1-6C)alkyl, alkylating the amino group of a corresponding compound of formula I in which  $R_{11}$  is hydrogen using a conventional method.

- 5 Generally preferred is a reductive alkylation using the appropriate aldehyde or ketone, for example as described in the Alkylation Methods in the Examples.

For a compound of formula I in which Lp comprises an azacycloalkyl or diazacycloalkyl group of formula

10

in which  $X_b$  is CH and  $(\text{L}_a)_s \text{---} (\text{G})_t \text{---} (\text{L}_b)_u$  is O and  $R_{10}$  is phenyl or pyridyl, coupling a corresponding compound containing a

15 group of formula

with phenols or 3-hydroxypyridine using Mitsunobu conditions, eg. DEAD (diethyl azodicarboxylate) /  $\text{Ph}_3\text{P}$  or 2-triphenylphosphonium 4,4-dimethyl-tetrahydro-1,2,5-thiadiazole to give aryloxy or 3-pyridoxy substituted

20 piperidines or pyrrolidine. Alternatively the hydroxy group may be reacted with sodium hydride and 2-chloro or 4-chloropyridine to give 2-pyridoxy or 4-pyridoxy substituted piperidines or pyrrolidines.

For a compound of formula I in which  $-L-Lp(D)_n$  is

in which  $Q$  is a direct bond, reductively alkylating an amine  
 5 of formula  $H-Q$  using a corresponding compound in which the  
 corresponding residue is a ketone of formula

The intermediates used in the process according to the  
 15 invention may generally, when not commercially available, be  
 prepared by conventional methods or as described in the  
 Examples herein.

For example, methyl 1-acetyl-3-formylindole-6-  
 carboxylic acid may be converted to the 3-formate by the

method of Merour et al (Synthesis, 1994, 411) and then reacted with trimethyl orthoformate to give methyl 1-acetyl-3-methoxyindole-6-carboxylate which is then hydrolysed to methyl 1-acetyl-3-methoxyindole-6-carboxylate.

5           5-Fluoroindole-6-carboxylic acid may be prepared from 4-fluoro-3-methoxyaniline by the following method. 4-Fluoro-3-methoxyaniline is treated with glyoxal-1,1-dimethyl acetal and then hydrogenated over Pd/C. The product is N-protected with methanesulphonyl chloride and then cyclised using  
10 titanium tetrachloride in toluene. Demethylation with BBr<sub>3</sub> to the phenol followed by reaction with triflic anhydride and then palladium carbonylation in methanol gives the methyl ester, which is then converted to 5-fluoro-1-methanesulphonylindole-6-carboxylic acid by hydrolysis with  
15 lithium hydroxide. This 'benzoyl' component may be reacted as previously described and deprotected by hydrolysis with sodium hydroxide at 100°C.

The intermediates disclosed herein, including the novel intermediates of formulae (V), (VI), (VII), (VIII) and (IX)  
20 are provided as further aspects of the invention.

The compounds of the invention may be administered by any convenient route, e.g. into the gastrointestinal tract (e.g. rectally or orally), the nose, lungs, musculature or vasculature or transdermally. The compounds may be  
25 administered in any convenient administrative form, e.g. tablets, powders, capsules, solutions, dispersions, suspensions, syrups, sprays, suppositories, gels, emulsions, patches etc. Such compositions may contain components conventional in pharmaceutical preparations, e.g. diluents,  
30 carriers, pH modifiers, sweeteners, bulking agents, and further active agents. Preferably the compositions will be

sterile and in a solution or suspension form suitable for injection or infusion. Such compositions form a further aspect of the invention.

The following are examples of pharmaceutical  
5 compositions of compounds according to the invention.

25 gelatin capsules in 460 mg quantities.

## Formulation 2

Tablets each containing 60 mg of active ingredient are made as follows:

5		
	Active Ingredient	60 mg
	Starch	45 mg
	Microcrystalline cellulose	35 mg

### Synthesis of inhibitors

**Method 1:** Using a solid phase strategy on a Protein Technologies, Symphony Multiple Peptide Synthesiser by attachment of bis amino compounds to Peg-trityl chloride resin: Trityl chloride resin was typically treated with greater than 2 fold excess of the di-amine in dry DCM .The resin was further modified by the attachment of acids. Activation of Fmoc protected amino acid (2-5eq) was by TBTU/ DIPEA, all couplings ( minimum 120 min.) were carried out in DMF. Deprotection of the Fmoc group was achieved with 20% piperidine in DMF. In the next stage other acid substituents were added as the HOBt or HOAt esters either by activation with HBTU/HATU or HATU/EDCI with or without Boc protection of amino groups. Cleavage of the products from the resin was by treatment (30 min., ambient) with 10% triethylsilane in

TFA, filtration, evaporation and trituration with diethylether.

Synthesis using the Symphony Multiple Peptide Synthesiser.

5

The Symphony Multiple Peptide Synthesiser is charged with DMF, DCM, TBTU in DMF (450 mM), DIPEA in DMF (900 mM), 20% piperidine in DMF. Resins are held in plastic reaction vessels that allow the introduction of reagents and solvents and nitrogen for agitation or air drying.

10

A typical synthesis cycle on the Symphony is as follows:-

The reaction vessel containing the resin (0.1 mmol) is charged with the Fmoc protected amino acid (0.5 mmol) and then this is dissolved in DMF (2.5ml), treated with TBTU (0.56 mmol, 1.25ml) and DIPEA (1.1 mmol, 1.25ml) and agitated with nitrogen for 2 hours (agitation times may vary). After coupling the resin is washed with DMF (6x 5ml) then deprotected with 20% piperidine in DMF (2x 5ml for 1 min.each, then 1x 5ml for 8 min.) the resin is then washed with DMF (6x 5ml).

#### Example 1.

25 1-(2-Amino-4-chlorobenzoyl-D-phenylglyciny1)-4,4'-bispiperidine

4,4-Bipiperidine.dihydrochloride (4mmol, 1g) was dissolved in water (5ml) and 2M sodium hydroxide solution (10mmol, 5ml) added. The solution was extracted with ethylacetate (2x 50ml) the combined extracts were washed with water, dried over anhydrous sodium carbonate, filtered and evaporated to give the 4,4 bipiperidine (0.35g) as a white solid. The 4,4

30

bipiperidine was dissolved in dry DMF (2ml) and added to  
Peg-tritylchloride resin (0.95 mmol/g, 1.5g) pre swollen in  
dry DCM (10ml). After 2h the resin was washed with DCM  
(6x5ml), DMF (6x5ml) and DCM (6x5ml). The resin was then air  
5 dried to allow aliquots to be taken.

The 4,4 bipiperidine trityl resin (0.1 mmol) was treated  
with Fmoc-D-Phenylglycine (0.5 mmol, 187mg), DMF(2.5ml),  
TBTU in DMF(1.25ml of a 450mM solution) and DIPEA in DMF  
10 (1.25ml of a 900 mM solution). The mixture was agitated with  
nitrogen for 2 hours. Deprotection and washing as above.

A solution of 4-chloroanthranilic acid (87mg 0.5mmole) in  
dry dimethylformamide (DMF) was treated successively with  
15 HOAt (102mg 0.75mmole) and EDCI (115mg 0.6mmole) and stirred  
at room temperature for 10min. The mixture was transferred  
to the reaction vessel on the Symphony and agitated for 2  
hours with nitrogen. The resin was washed with DMF (6x5ml),  
DCM (6x5ml) and air dried. The product was cleaved from the  
20 resin with 10% triethylsilane in TFA (10ml) for 30 minutes,  
the resin filtered off and the TFA solution evaporated to  
dryness and triturated with diethyl ether to give the crude  
product. The crude product was dissolved in water (10ml),  
filtered and purified by preparative reverse phase Hplc.

Method 2: By solution phase strategy: Typically an activated  
20 amino acid was treated with an amine (primary or secondary)  
or alcohol (1eq.). Activation of the protected amino acid  
(Boc or Cbz protection) was by HATU/DIPEA (1:2) by  
TBTU/DIPEA (1:2), by HOBT or HOAt and a carbodiimide (EDCI  
or DCC), or by diethyl cyanophosphonate and triethylamine or  
25 DIPEA, all couplings (minimum 120min.) were carried out in  
DMF without or without dichloromethane as co-solvent. After  
an aqueous work up the deprotection of the Boc group was  
achieved with TFA. Other acid substituents were added as the  
HOBT or HOAt esters either by activation with HBTU/HATU, EDC  
30 or DIPCI with or without Boc protection of amino groups. The  
final products were purified by preparative reverse phase  
Hplc.

**Examples 19-126**

The compounds of Examples 19-126 were prepared by the method described below, but using the appropriate starting materials.

Boc D-phenylglycine (251 mg, 1 mmol.) was dissolved in DMF(3ml) with HATU (380 mg., 1 mmol.) and DIPEA(350µl ., 2 mmol.). To this mixture was added 4-methylbenzylamine(121mg., 1 mmol.) and DIPEA (170µl., 1 mmol.). The mixture was stirred overnight. The mixture was then taken up into ethylacetate and washed with water, sodium carbonate solution, water, 10% hydrochloric acid solution and water. The ethylacetate was evaporated without drying and treated immediately with TFA for 30 min. The TFA was then evaporated to dryness and the product triturated with diethylether. TEA(1ml) was added and evaporated to dryness. A solution of 3-hydroxymethylbenzoic acid (76mg , 0.5mmole) in dry dimethylformamide (DMF) was treated with TBTU (161mg., 0.5mmol.) and DIPEA (1.5 mmol.). The mixture was then added to the D-phenylglycine-4-methylbenzylamide (0.5mmol.) and stirred overnight. The crude product was dissolved in water/acetonitrile (20ml), filtered and purified by preparative Hplc to yield pure product.

Preparation of starting materials:

**Boc-R-4-(carboxymethyl)phenylglycine**

5 **R-4-Hydroxyphenylglycine methyl ester hydrochloride.**

To a dry 250ml three necked round bottom flask, equipped with a low temperature thermometer, a septum for nitrogen coverage and another for introduction of thionyl chloride by syringe, was added R-4-hydroxyphenylglycine (12.5g) and dry  
10 methanol (24ml). The mixture was stirred (magnetic stirrer) and cooled to an internal temperature of -20°C using cardice/acetone. Using a syringe, thionyl chloride was added dropwise to the cooled mixture over a period of 10min.  
(Care: the reaction of thionyl chloride with methanol is  
15 very exothermic and rate of addition should be such that the thionyl chloride is efficiently stirred into the mixture and that the temperature does not rise above -20°C. Once the addition was complete the mixture was allowed to warm to room temperature overnight (16-18hr). Dry ether (150ml) was  
20 added and the white ppt. that formed was filtered off, washed with a little more ether and dried. Yield 15.5g 95%.

**Boc-R-4-Hydroxyphenylglycine methyl ester hydrochloride**

25 To a stirred mixture of R-4-hydroxyphenylglycine methyl ester hydrochloride 14g and sodium bicarbonate 11.7g in tetrahydrofuran (THF) 150ml and water 50ml, was added in one portion, di- t-butyl dicarbonate 15.9g. The mixture was stirred rapidly to allow thorough mixing for 4h. Hexane  
30 (75ml) was added and the organic layer separated and washed

with sat. sodium bicarbonate solution, then brine and then dried with magnesium sulphate. The drying agents was filtered off and washed with a little THF and evaporated to dryness, finishing with a high vacuum pump to remove the last traces of di- t-butyl dicarbonate. Yield 19.7g 96%.

**Boc-R-4-(trifluoromethanesulphonyloxy)phenylglycine methyl ester hydrochloride**

To a stirred solution of Boc-R-4-hydroxyphenylglycine methyl ester 19g in dichloromethane 400ml was added 2,6-lutidine 9.44ml and 4-dimethylaminopyridine 1.65g and the mixture cooled in an ice bath. Trifluoromethanane-sulphonic anhydride 13.74ml was added over a period of 5min and then the reaction left to warm to room temperature over 4h. The organic solution was washed with water, 2 x 150ml, 1N HCl 2 x 150ml and the saturated sodium bicarbonate 150ml. The organics were dried with magnesium sulphate and then evaporated to and oil. The mixture was purified using flash chromatography (SiO<sub>2</sub> 250g eluting with 1:1 hexane/dichloromethane and then neat dichloromethane). Pure product fractions were combined and evaporated, finishing with a high vacuum pump to remove all traces of solvent, to give a white solid, 19g 77%. Nmr.

were placed in the glass liner of the Parr reactor and the reactor assembled. The vessel was pressurised to ~10psi with nitrogen and the gas released (repeated five times to remove all oxygen from the system). Carbon monoxide gas was then

10 added to ~100psi and the stirrer started. The vessel was slowly heated to 65°C internal temperature and then stirred at 65°C overnight. (At the early stages more carbon monoxide was added to maintain ~100psi) A sample was removed after 18h and examined by tlc. When complete, the reaction was  
15 cooled to ~30°C, the gas released and the vessel flushed five times with nitrogen as before. The reaction mixture was partitioned between ethyl acetate and water and the organic layer washed with 1M hydrochloric acid and then saturated sodium bicarbonate. (R)-2-[(Butoxycarbonyl)amino]-2-phenylethyl azide (47.8 g, 0.182 mole) was added to trifluoroacetic acid (500 mL) with stirring and ice-water bath cooling. The cooling bath was removed, the reaction was allowed to stir 1 h, and the solvent was removed in vacuo at 35 °C water bath temperature. The residue was co-evaporated with toluene to give a weight of 75.0 g. 30 methyl)piperazine trifluoroacetate

1- [D- (+)-Benzyloxycarbonylphenylglyciny] - (4-tert-butoxy-carbonyl)piperazine.

(Coupling Method A) D-(+)-Benzyloxycarbonylphenylglycine (58.0 g, 203 mmol) and 1-Boc-piperazine (41.7 g, 224 mmol) were dissolved in DMF (1 L) and cooled to approximately -15 °C in an ice-methanol bath. Diethyl cyanophosphonate (37.0 mL, 244 mmol) was slowly added to the mixture.

Triethylamine (59.4 mL, 426 mmol) was added dropwise to the solution. The mixture was stirred at -15 °C for 2 h and was allowed to gradually warm to room temperature overnight.

The mixture was diluted with ethyl acetate and water. The layers were separated, and the water layer extracted with ethyl acetate. The organic layers were combined, washed with 10% citric acid (2 x 500 mL) and brine, dried (Na<sub>2</sub>SO<sub>4</sub>), filtered and concentrated under vacuum. The crude product was filtered through a plug of silica gel (1.2 kg) using 1:1 hexanes:ethyl acetate as eluent to provide 1-[D-(+)-benzyloxycarbonylphenylglyciny] -4-(tert-butoxycarbonyl)piperazine (69.9 g, 76%) as a colorless oil.

1- [D- (+)-Benzyloxycarbonylphenylglyciny] -4- (tert-butoxycarbonyl)piperazine (69.5 g, 153 mmol) was dissolved in ethanol (500 mL). The mixture was degassed with nitrogen and Pd/C (6.8 g) was added. Hydrogen was bubbled through the mixture for 1 h, and it was maintained under a hydrogen atmosphere for 16 h. The Pd/C was removed by filtration through cellulose powder. The filter cake was rinsed with ethanol and ethyl acetate. The filtrate was concentrated under vacuum to give 1-[D-(+)-phenylglyciny] -4-(tert-

To a stirring solution of acetoxime (98 mg, 7.1 mmol) in DMF  
15 (5 mL) was added a 1 M solution of potassium tert-butoxide  
(1.3 mL, 1.3 mmol) in THF. After 2 min, 1-(3-cyano-4-  
fluorobenzoyl-D-phenylglyciny)-1'-methyl-4,4'-bispiperidine

solvent was partially removed and the residue was  
20 partitioned between brine and dichloromethane. The layers  
were separated and the aqueous phase was extracted another  
two times with dichloromethane. The combined organics were  
dried (MgSO<sub>4</sub>), filtered and concentrated in vacuo.

The residue was then dissolved in ethanol (3.6 mL) and 1 N

After 5 h, the heating mantle was removed and after  
cooling, the solution was diluted ethyl acetate and water.

30 The pH of the aqueous phase was adjusted to 11 with 2 N  
sodium hydroxide and extracted twice with dichloromethane.  
The combined dichloromethane extracts were dried (MgSO<sub>4</sub>),

filtered and concentrated in vacuo. The resulting solid was dissolved in a minimum amount of dichloromethane and chromatographed over silica gel, eluting with 2% methanol (containing 2 N ammonia) in dichloromethane through 10% methanol (containing 2 N ammonia) in dichloromethane. The product containing fractions were combined and concentrated in vacuo to give 89 mg (29%) of an off-white solid.

Enzyme Inhibition assays:

The ability of a test compound to inhibit factor Xa may be evaluated in one or more of the following Enzyme Inhibition assays, or in other standard assays known to those skilled  
5 in the art.

#### Enzyme Inhibition Assay 1

Enzyme assays were carried out at room temperature in 0.1M  
10 phosphate buffer, pH7.4 according to the method of Tapparelli et al (J. Biol. Chem. 1993, 268, 4734-4741). Purified human factor Xa, trypsin, thrombin and plasmin were purchased from Alexis Corporation, Nottingham, UK. Urokinase was purchased from Calbiochem, Nottingham, UK. Chromogenic  
15 substrates for these enzymes; pefachrome-FXA, pefachrome-TRY, pefachrome-TH, pefachrome-PL and pefachrome-UK were purchased from Pentapharm AG, Basel, Switzerland. Product (p-nitroaniline) was quantified by adsorption at 405nm in 96 well microplates using a Dynatech MR5000 reader (Dynex Ltd,  
20 Billingshurst, UK). Km and Ki were calculated using SAS PROC NLIN (SAS Institute, Cary, NC, USA, Release 6.11) Km values were determined as 100.9µM for factor Xa/pefachrome-FXA and 81.6µM for trypsin/pefachrome-TRY. Inhibitor stock solutions were prepared at 40mM in Me2SO and tested at 500µM, 50µM and  
25 5µM. Accuracy of Ki measurements was confirmed by comparison with Ki values of known inhibitors of factor Xa and trypsin.

In agreement with published data, benzamidine inhibited  
30 factor Xa, trypsin, thrombin, plasmin and urokinase with Ki values of 155µM, 21µM, 330nM, 200nM and 100nM respectively. NAPAP inhibited thrombin with a Ki value of 3nM. Compounds

of the invention were found to have activity in these assays.

#### Enzyme Inhibition Assay 2

5

Human factor Xa and human thrombin were purchased from Enzyme Research Laboratories (South Bend, Indiana, USA). Other proteases were from other commercial sources. Chromogenic para-nitroanilide peptide protease substrates  
10 were purchased from Midwest Biotech (Fishers, Indiana, USA).

The binding affinities for human factor Xa were measured as apparent association constants ( $K_{ass}$ ) derived from protease  
15 inhibition kinetics as described previously.<sup>a,b,c,d</sup> The apparent  $K_{ass}$  values were obtained using automated (BioMek-1000) dilutions of inhibitors ( $K_{ass}$  determinations are performed in triplicate at each of four-eight inhibitor concentrations) into 96-well plates and chromogenic  
20 substrate hydrolysis rates determined at 405 nm using a Thermomax plate reader from Molecular Devices (San Francisco). For factor Xa inhibition, the assay protocol was: 50  $\mu$ l buffer (0.06 M tris, 0.3 M NaCl, pH 7.4); 25  $\mu$ l inhibitor test solution (in MeOH); 25  $\mu$ l human factor Xa (32  
25 nM in 0.03 M tris, 0.15 M NaCl, 1 mg/ml HSA); finally, 150  $\mu$ l BzIleGluGlyArgpNA (0.3 mM in water) added within 2 min to start hydrolysis. Final factor Xa was 3.2 nM. Free [Xa] and bound [Xa] were determined from linear standard curves on the same plate by use of SoftmaxPro software for each  
30 inhibitor concentration and apparent  $K_{ass}$  calculated for each inhibitor concentration which produced hydrolysis inhibition between 20% and 80% of the control (3.2 nM factor

Xa): apparent  $K_{ass} = [E:I]/[E_f][I_f] = [E_b]/[E_f][I^0 - I_b]$ .

The apparent  $K_{ass}$  values so obtained are approximately the inverse of the  $K_i$  for the respective inhibitors [ $1/\text{app}K_{ass} = \text{app} K_i$ ]. The variability of mean apparent  $K_{ass}$  values

5 determined at the single substrate concentration was +/- 15%. The assay system  $K_m$  was measured as  $0.347 \pm 0.031$  mM [ $n=4$ ]; and  $V_{max}$  was  $13.11 \pm 0.76$   $\mu\text{M}/\text{min}$ .

$K_{ass}$  values were determined with thrombin and other  
10 proteases using the same protocol with the following enzyme and substrate concentrations: thrombin 5.9 nM with 0.2 mM BzPheValArgpNA; XIa 1.2 nM with 0.4 mM pyroGluProArgpNA; XIIa 10 nM with 0.2 mM HDProPheArgpNA; plasmin 3.4 nM with 0.5 mM HDValLeuLyspNA; nt-PA 1.2 nM with 0.8 mM  
15 HDileProArgpNA; and urokinase 0.4 nM with 0.4 mM pyroGluGlyArgpNA; aPC 3 nM with 0.174 mM pyroGluProArgpNA; plasma kallikrein 1.9 nM with D-PropheArgpNA; bovine trypsin 1.4 nM with 0.18 mM BzPheValArgpNA.

The ability of a test compound to elongate Partial Thromboplastin Time (Prothrombin Time) may be evaluated in the following test protocols.

30 Partial Thromboplastin Time (Prothrombin) Test Protocol

Venous blood was collected into 3.2% (0.109M) trisodium citrate vacutainer tubes at 1 volume of anticoagulant to nine volumes of blood. The blood cells were separated by centrifugation at 700g for ten minutes to yield plasma,  
5 which was frozen at 70°C until required.

To perform the test, 100µl of plasma was pipetted into a glass test tube, 1µl of test compound in DMSO was added, and allowed to warm to 37° over two minutes. 100µl of warm (37°) Manchester (tissue thromboplasin) reagent (Helena  
10 Biosciences, UK) was added, allowed to equilibrate for two minutes. 100µl of warm (37°) 25mM calcium chloride solution was added to initiate clotting. The test tube was tilted three times through a 90° angle every five seconds to mix the reagents and the time to clot formation recorded. Data  
15 from a series of observations and test compound concentrations are analysed by a SAS statistical analysis program and a CT2 (Concentration required to double clotting time) for each compound is generated.

20 Compounds of the invention were found to significantly elongate the partial thromboplastin time (Prothrombin time).

a The concentration quoted is that of the solution which, when added to the other reagents in the assay, doubles prothrombin time. The final concentration in the assay mixture is one third of this value.

By way of comparison with the result for the compound of Example 66, the compound of Example 75 of WO99/11657 was found to double prothrombin time at a concentration of 11.4 $\mu$ M (average of 3 tests).

By way of comparison with the result for the compound of Example 35, 1-aminoisoquinolin-7-oyl-D-phenylglycine-4-(4-fluoro-2-methanesulfonylphenyl)-piperazinamide ditrifluoroacetate salt (a compound within the scope of WO99/11657) was found to double prothrombin time at a concentration of 45 $\mu$ M (average of 3 tests).

#### Alternative Prothrombin Time and APTT Protocols

Coagulation Determinations. Prothrombin Times and APTT values were determined in HUMAN PLASMA with a STA instrument (Stago). BioPT is a special non-plasma clotting assay triggered with human tissue factor (Innovin). Possible binding to albumen or to lipid was assessed by comparing the BioPT effects in the presence/absence of 30 mg/ml human

albumen (HSA) and 1 mg/ml phosphatidyl choline (PC).  
Inhibitors were delivered in 50% MeOH vehicle.
